Obtain public data by REST API

- REST API curl command or URL address to enter at the web browser :

https://dog.ceo/api/breeds/image/random

- Example output data that you have obtained :

{"status":"success","message":"https://images.dog.ceo/breeds/leonberg/n02111129_324.jpg"}

To see the picture then copy
https://images.dog.ceo/breeds/leonberg/n02111129_324.jpg in web browser
so we can get the picture like this

- One paragraph describing what data you have obtained :

This API is about random dog images. We can random more than one dog image by
https://dog.ceo/api/breeds/image/random/**5** <-- "5" means that we will get 5 random dog
images. As you can see the URL that we obtain from JSON, we can also know that dog's
breed. In the example output data
"https://images.dog.ceo/breeds/**leonberg**/n02111129_324.jpg" <-- so the dog's breed in this
image is leonberg.

- URL linking to the REST API reference document for the public data
repository you have obtained : https://dog.ceo/dog-api/documentation
